Tool-Supported Fault Localization in Spreadsheets: Limitations of Current Evaluation Practice

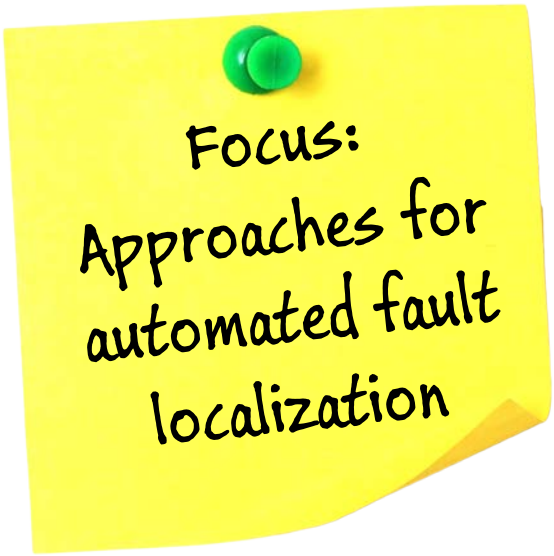
Birgit Hofer, Franz Wotawa

Dietmar Jannach, Thomas Schmitz

Kostyantyn Shchekotykhin

Int. Workshop on Software Engineering Methods in Spreadsheets (SEMS), July 2014, Delft, Netherlands

An Overview of Limitations of Current Evaluation Practice



1. Lack of benchmarks systems
2. Usability and user acceptance
3. Field research

Hofer, Jannach, Schmitz, Shchekotykhin, Wotawa: „ Tool-supported fault localization in spreadsheets: Limitations of current evaluation practice“, Int. Workshop on Software Engineering Methods in Spreadsheets (SEMS), July 2014, Delft, Netherlands

1 Benchmark Systems – Current Situation

- There is no public data set for spreadsheet fault localization
- Researcher create own benchmark systems
  - Take existing corpus (e.g. EUSES [FR05]) or collect individual spreadsheets
  - Apply mutation operators, e.g. [AE09] on them or manually inject faults

[FR05] M. Fisher and G. Rothermel: “The EUSES spreadsheet corpus: A shared resource for supporting experimentation with spreadsheet dependability mechanisms.” 1st Workshop on End-User Software Engineering, 2005.

[AE09] R. Abraham and M. Erwig. Mutation Operators for Spreadsheets. IEEE Transactions on Software Engineering, 2009.

Some Examples I

- Hofer et. al [HRW13]
  - "… we are evaluating the … approaches by means of the **EUSES spreadsheet corpus**. We **skipped** around 240 Excel 5.0 spreadsheets that are **not compatible** with our implementation, …
  - we **removed all spreadsheets containing less than 5 formulas** …
  - we **automatically created** up to five first-order **mutants**. A mutant of a spreadsheet is created by randomly choosing a formula cell of the spreadsheet and applying a mutation operator on it. According to the classification of spreadsheet **mutation operators of Abraham and Erwig**, we used the following mutation operators …"

- Jannach and Schmitz [JS14]
  - "For the performance analysis, we selected a number of **artificial and real-world spreadsheets** in which we **manually injected faults**."

[HRW13] B. Hofer, A. Riboira, F. Wotawa, and R. Abreu, E. Getzner: "On the Empirical Evaluation of Fault Localization Techniques for Spreadsheets." FASE 2013.

[JS14] D. Jannach and T. Schmitz: "Model-based diagnosis of spreadsheet programs - A constraint-based debugging approach." *Automated Software Engineering, Springer, 2014.*

Some examples II

- Abraham and Erwig [AE08]
  - "… we use **spreadsheets** that have been **used in previous empirical studies**. The spreadsheets have been **picked** to include as many different kinds of formulas, and formulas with branching …
  - We generate mutant spreadsheets by **seeding faults** in the original spreadsheets using the **mutation operators** given in Table 1. The mutation operators have been **designed to reflect errors** reported in spreadsheet literature …"

- Außerlechner et al. [AFW13]
  - "Since MINION is not able to deal with Real numbers …, we **created a specific spreadsheet corpus** that contains spreadsheets with Integer values only … Whereas some of the spreadsheets are **artificially created**, 21 spreadsheets are **real-life** programs … "

[AE08] R. Abraham, and M. Erwig: "Test-Driven Goal-Directed Debugging in Spreadsheets." IEEE Symposioum on Visual Languages and Human-Centric Computing, 2008.

[AFW13] S. Ausserlechner et al.: "The Right Choice Matters! SMT Solving Substantially Improves Model-Based Debugging of Spreadsheets." QSIC 2013.

Current Situation - Consequences

- Each research group uses own data set
  - rarely made publicly available
  - often made to fit the evaluated approach
  - comparison of approaches difficult

Hofer, Jannach, Schmitz, Shchekotykhin, Wotawa: „ Tool-supported fault localization in spreadsheets: Limitations of current evaluation practice“, Int. Workshop on Software Engineering Methods in Spreadsheets (SEMS), July 2014, Delft, Netherlands

We need a corpus that contains …

- Real world spreadsheets
- Large spreadsheets, not toy examples
- Spreadsheets with real faults, not only seeded faults
- Input-/output relations that reveal the fault

Hofer, Jannach, Schmitz, Shchekotykhin, Wotawa: „ Tool-supported fault localization in spreadsheets: Limitations of current evaluation practice“, Int. Workshop on Software Engineering Methods in Spreadsheets (SEMS), July 2014, Delft, Netherlands

Ways to get there

- Laboratory: spreadsheet construction exercises
  - Excellent starting point: Kooper Corpus [AP10]
    - Larger spreadsheets
    - Different domains and exercises
- Real life

[AP10] S. Aurigemma, and R. Panko: “The detection of human spreadsheet errors by humans versus inspection (auditing) software,” *CoRR, 2010.*

2 Usability and User Acceptance

- Mostly offline experiments
- Information from the user required, e.g.
  - Correctness of values
  - Expected values
  - Specification of several test cases

→Is a user willing / able to provide these inputs?

→ User studies are necessary to answer these questions.

Hofer, Jannach, Schmitz, Shchekotykhin, Wotawa: „ Tool-supported fault localization in spreadsheets: Limitations of current evaluation practice“, Int. Workshop on Software Engineering Methods in Spreadsheets (SEMS), July 2014, Delft, Netherlands

3 Field research

- Setting
  - Laboratory experiments vs. everyday use
- Participant
  - Students vs. managers
- Scenario
  - Artificial problem vs. real problem

Hofer, Jannach, Schmitz, Shchekotykhin, Wotawa: „ Tool-supported fault localization in spreadsheets: Limitations of current evaluation practice“, Int. Workshop on Software Engineering Methods in Spreadsheets (SEMS), July 2014, Delft, Netherlands

Proposals for future work

→ Improve comparability and reproducibility
Develop common benchmark system

→ Focus on usability and user acceptance
Make user studies

→ Focus on real life scenarios (not only laboratory experiments)
Make field research, questionnaires …
